Introduction to the Programmes

This handbook provides you with specific information about the MSc Biology & Control of Parasites & Disease Vectors (BCPDV) and MSc Molecular Biology of Parasites & Disease Vectors (MBPDV). You will also be provided with a general student handbook which covers issues common to all Masters students studying at the School. It is most important that you are aware of the information provided in these handbooks.

Since 1898, the Liverpool School of Tropical Medicine has gathered students with varied backgrounds from all over the world. The two laboratory-based MSc programmes (MSc Biology & Control of Parasites & Disease Vectors and MSc Molecular Biology of Parasites & Disease Vectors) have their origin in the MSc in Applied Parasitology and Medical Entomology, started in 1963 by Dr W Crewe on his return from ground-breaking studies on Calabar swelling (caused by *Loa loa*) in Cameroon. Since then the names and content of the programmes have evolved in response to the ongoing challenges we face and the new technologies that have been developed. However, our underlying philosophy of providing excellence in teaching and research relevant to developing countries has not altered. To date we have educated over 400 Masters students, many of whom have established successful careers in research in the academic or private sectors, or who have gone on to work in development as part of government or NGO teams.

MSc/ Diploma/ Certificate in Biology & Control of Parasites & Disease Vectors

Programme Aims and Learning Outcomes (BCPDV)

Outline

This programme provides advanced contemporary training in parasitology and the study of disease vectors. The broad scope of the programme ranges from the biology, immunology, ecology and population biology of the organisms to public health and disease epidemiology. In addition to providing a solid foundation in parasite and vector biology, the programme provides practical experience of essential techniques, as well as significant theoretical and practical knowledge in all important and topical areas of the field, all taught within an active and exciting scientific environment. The full programme specification can be viewed on the LSTM website

Aims

The curriculum has been informed by current national and international priorities and policies in the field of biology and control of parasites and disease vectors. The programme aims to:

- Equip students with the knowledge and practical skills needed to develop a career in research, training or control of pathogens, parasites, organisms of importance to public health and vector-borne diseases.
- Provide practical experience of a range of specialised technical and analytical skills relevant to the study of pathogens, parasites, organisms of importance to public health and disease vectors.
- Enable students to conduct independent research in the laboratory and/or field
- Produce graduates who are experienced, committed, informed, proactive and effective professionals, capable of taking substantial and leading professional roles
- Facilitate high quality learning that is informed by critical analysis of current research
- Develop independent and reflective approaches to study that will enable graduates to continue to learn in the future

Subject-based learning outcomes

This specification provides a concise summary of the main features of the programme and the learning outcomes that a typical student might reasonably be expected to achieve and demonstrate if s/he takes full advantage of the learning opportunities that are offered.

A. Knowledge and Understanding

Upon successful completion of the programme a student should have developed and be able to demonstrate:

A1. A systematic understanding and critical awareness of current issues and priorities in the field of biology and control of pathogens, parasites, organisms of importance to public health and disease vectors

A2. Knowledge of a range of relevant research methods and understanding of how the methods can be applied to address particular research questions

A3. Ability to apply statistical knowledge and understanding to design a research study and to analyse and interpret critically data

A4. Knowledge and understanding of the biology and epidemiology of pathogens, parasites, organisms of importance to public health and vectors and the diseases of medical importance that they cause

A5. Critical understanding of current methods for preventing human disease and an appreciation of research developments in the study of organisms of importance to public health, parasite, pathogen and vector biology that may lead to the development of novel control strategies.

B. Cognitive skills

Upon successful completion of the programme a student should be able to:

B1. Analyse, synthesise and evaluate information from a variety of sources in a critical manner

B2. Apply subject knowledge and understanding in a variety of contexts to analyse and reach evidence-based conclusions on complex situations, problems and opportunities

B3. Apply the principles and values of ethical practice with regard to the design and practice of research studies, consent and confidentiality in the collection and presentation of data, and publication

B4. Demonstrate creativity, innovation and originality in the application of knowledge

C. Practical/professional skills

Upon successful completion of the programme a student should be able to:

C1. Formulate a research question, devise an appropriate research strategy and take a systematic approach to project planning and management

C2. Undertake research investigations in a responsible, safe and ethical manner and accurately record the data collected

C3. Effectively manage, analyse and report data collected in the laboratory or field

Programme Structure (BCPDV)

The programme is offered within a dynamic research-led environment and its content is informed by the cutting-edge research activities of the academic staff. It is designed to develop self-directed learning, to enable the professional development of the student and to be relevant to students from both the UK and overseas.

The programme comprises an introductory induction week, followed by taught modules totalling 120 credits and a 60-credit dissertation (Table 1). A 10 credit module (5 ECTS credits) represents 100 hours of student learning activity including assessment and self-directed study.

Required modules are necessary to achieve the programme learning outcomes and must be taken by all students following the programme. The optional modules listed have been identified as most suitable for contributing to the attainment of the programme learning outcomes. However, depending on their background or interests, students may opt to replace these optional modules with modules offered as part of other LSTM MSc programmes, subject to the agreement of the Director of Studies for the programme (see Table 2)

MSc/ Diploma /Certificate in Molecular Biology of Parasites & Disease Vectors

Programme Aims and Learning Outcomes (MBPDV)

Outline

Molecular biology and genomics play an increasingly important and exciting role in research on medically important parasites and arthropods, and this award provides advanced training in this field. It provides an important foundation of knowledge of the basic biology of parasites and vectors, followed by specialised modules on the molecular and cellular biology and functional genomics of parasites and vectors, and culminating in a molecular research project on a topic chosen by the student. There is a significant practical component throughout the programme, and the laboratory work undertaken provides a wide range of techniques that would be highly relevant to a future research career. The full programme specification can be viewed on the LSTM website.

The curriculum has been informed by current national and international priorities and policies in the field of molecular biology of parasites and disease vectors. The programme aims to:

- Equip students with the knowledge and practical skills to develop a career in molecular research, training or control of pathogens, parasites, organisms of importance to public health and vector-borne diseases.
- Provide practical experience of a range of specialised technical and analytical skills relevant to the study of the molecular biology of pathogens, parasites, organisms of importance to public health and disease vectors.
- Enable students to conduct independent research in the laboratory and/or field
- Produce graduates who are experienced, committed, informed, proactive and effective professionals, capable of taking substantial and leading professional roles
- Facilitate high quality learning that is informed by critical analysis of current research
- Develop independent and reflective approaches to study that will enable graduates to continue to learn in the future

Subject-based learning outcomes:

This specification provides a concise summary of the main features of the programme and the learning outcomes that a typical student might reasonably be expected to achieve and demonstrate if s/he takes full advantage of the learning opportunities that are offered.

A. Knowledge and Understanding

Upon successful completion of the programme a student should have developed and be able to demonstrate:

A1. A systematic understanding and critical awareness of current issues and priorities in the field of molecular biology of pathogens, parasites, organisms of importance to public health and disease vectors

A2. Knowledge of a range of relevant research methods and understanding of how the methods can be applied to address particular research questions

A3. Ability to apply statistical knowledge and understanding to design a research study and to analyse and interpret critically data

A4. Knowledge and understanding of the molecular biology and epidemiology of pathogens, parasites, organisms of importance to public health and vectors and the diseases of medical importance that they cause

A5. Critical understanding of current methods for preventing human disease and an appreciation of research developments in the study of organisms of importance to public health, parasite, pathogen and vector biology that may lead to the development of novel control strategies

B. Cognitive skills

Upon successful completion of the programme a student should be able to:

B1. Analyse, synthesise and evaluate information from a variety of sources in a critical manner

B2. Apply subject knowledge and understanding in a variety of contexts to analyse and reach evidence-based conclusions on complex situations, problems and opportunities

B3. Apply the principles and values of ethical practice with regard to the design and practice of research studies, consent and confidentiality in the collection and presentation of data, and publication

B4. Demonstrate creativity, innovation and originality in the application of knowledge

C. Practical/professional skills

Upon successful completion of the programme a student should be able to:

C1. Formulate a research question, devise an appropriate research strategy and take a systematic approach to project planning and management

C2. Undertake research investigations in a responsible, safe and ethical manner and accurately record the data collected

C3. Effectively manage, analyse and report data collected in the laboratory or field

Programme Structure (MBPDV)

The programme is offered within a dynamic research-led environment and its content is informed by the cutting-edge research activities of the academic staff. It is designed to develop self-directed learning, to enable the professional development of the student and to be relevant to students from both the UK and overseas.

The programme comprises an introductory induction week, followed by taught modules totalling 120 credits and a 60-credit dissertation (Table 3). A 10-credit module (5 ECTS credits) represents 100 hours of student learning activity including assessment and self-directed study. Required modules are necessary to achieve the programme learning outcomes and must be taken by all students following the programme. The optional modules listed have been identified as most suitable for contributing to the attainment of the programme learning outcomes. However, depending on their background or interests, students may opt to replace these optional modules with modules offered as part of other LSTM MSc programmes, subject to the agreement of the Director of Studies for the programme (see Table 4)

Important Dates

MSc Project choices deadline – 17 October 2017

Deadline for Semester 2 module choices – 24 November 2017

Allocating/defining dissertation topics: September-November 2017

Developing proposal for Dissertation Project: September 2017-January 2018

Submission to Masters Ethics Committee (if required): February 2018

Fieldwork: April/May – June/July 2018

Dissertation writing: June – August 2018

Dissertation Submission deadline: 16 August 2018

Board of Examiners meeting: October 2018

Release of results: Following Board of Examiners meeting

Graduation Ceremonies: December 2018

Research Project

Many students carry out a fieldwork-based dissertation project overseas. Others opt to conduct fieldwork in the UK or to carry out another type of study (using literature or data already collected) that does not involve travelling abroad. Whilst overseas, students are supervised by a designated person in the host country, as well as by a member of LSTM staff. All projects have the key aims of developing students' skills in formulating a research question, designing and implementing a research project and critically interpreting and presenting the findings. Further information regarding the dissertation will be provided elsewhere.

Where appropriate, research proposals must be approved by the MSc Ethics Review Panel of the Liverpool School of Tropical Medicine and by in-country Ethics boards or committees. Further information and guidance on preparing a submission to the Ethics Committee will be provided during TROP934.

Preston Montford Field Course

The programmes begin the week prior to the formal induction programme with the Field Course held in Preston Montford, near Shrewsbury in rural Shropshire. The purpose of the Field Course is to introduce you, in nature, to representatives of most of the parasite and insect groups which you will study in detail later, as well as methods of collecting and studying these in the field.

It is also intended that you should get to know each other and some of the staff under relaxed informal conditions. The Field Course is not formally assessed. You will be issued with a Handbook for this Field Course.

Changing Programmes

It is possible to change programmes before the end of the first Semester since the modules are identical until then. If you wish to change programmes, please discuss this with Dr La Course.

Dr E Wright	Microbiology	Old School, Comm Rm	2554	Elli.wright

Essay Writing Guidelines

During the programme you will be asked to write a number of essays for the assessment of modules. The length of the essay will be specified in the assessment guidance for each module. Essays are an essential part of the learning process and are designed to help develop and deepen your understanding.

One important feature of essay writing, on this programme, is the use of appropriate literature and the correct acknowledgement of it. Most of the essay titles require the most up to date information. This information is not (usually) found in books, but in scientific journals, and it is strongly recommended that the full facilities of the library including web-based sources are used to obtain the required information.

The following publications available in the LSTM library are good starting points to find up to date information on topics relevant to your essays:-

Trends in Parasitology (formerly Parasitology Today). This is a current awareness journal published monthly and is ideal for students wishing to be kept up to date with current ideas in parasitology and entomology.

Advances in Parasitology. An annual publication gathering useful, concise articles on various research issues in the field of parasitology.

The "**Annual review of**" series give useful, "state-of-the-art" overviews of various topics. Available in the School library are: *Annual Review of Biochemistry*, *Annual Review of Entomology*, *Annual Review of Microbiology*.

Practical Classes

The programme contains a great deal of practical work of all types and in order to take full advantage, it is essential that you keep a well-ordered laboratory notebook. The notebook can be used for your own notes and drawings and any handouts provided for the practical.

The practicals which follow many parasitology lectures may allow you to observe stages of parasites in blood and stools and are highly relevant to diagnosis, which is also emphasised in the diagnostic parasitology sessions. In addition, there are fixed demonstrations in the laboratory which illustrate other important features of the parasites under study. You are advised to make notes and simple sketch drawings of the material you see in these classes.

The entomology demonstrations following many lectures contain specimens illustrating the topics covered in the lectures. The special entomology practicals allow you to experience a number of important practical entomological techniques such as dissections of various types.

The basic laboratory techniques practicals contain a wide range of techniques that are considered important for all students and which will be highly relevant to all your future laboratory work.

Within the optional modules more advanced experiments will be carried out and it is very important that these are written up properly. A proper record will include details of the aims of the experiment, the materials and methods, the results and the conclusions.

Prizes

Jervis Prize

The Jervis Prize is awarded at the final Examiner's meeting to the candidate with the highest mark in the overall examination for MSc in Biology & Control of Parasites & Disease Vectors or Molecular Biology of Parasites & Disease Vectors

David Smith Memorial Prize

The David Smith Memorial Prize is awarded to a student from a developing country who has contributed most to the collective and team work of students on her/his programme. It is open to students on any programme.

David Smith was a member of staff of the School for many years and was head of the Tropical Medicine Division in the School at the time of his tragically early death. A former Director of the UK Medical Research Councils unit in Kisumu, Kenya, he was also at one time head of the vector-borne disease division of the Kenyan Ministry of Health. He worked extensively in Africa on the control of tropical diseases, including malaria, sleeping sickness and haemorrhagic viral infections. In addition he had extensive knowledge of South America and Asia and worked for a year on secondment to the British Government's overseas development ministry, assisting them in developing more effective policies in health and disease control. He played a key role in the establishment of the Malaria Consortium as a joint operation of the Liverpool and London Schools.

Andrew Campbell Memorial Fund

Andrew Campbell was an MSc student who died tragically shortly after completing the programme in 1986. In his memory, a fund was raised for the benefit of future students on the former Master of Science in Applied Parasitology and Medical Entomology Programme. Students registered on either the MSc in Biology & Control of Parasites & Disease Vectors or Molecular Biology of Parasites & Disease Vectors are eligible to apply to this fund.

Approximately £100 is available to the student who makes the best appropriate case for the use of the money in the furtherance of his/her career in tropical medicine when they leave Liverpool.

Applications, which should outline the proposed use of the money and explain how this will benefit your career, on not more than one side of A4, are invited **before the end of September** each year. The award (if any) will be made at the October Board of Examiner's meeting, and the result notified to the successful candidate by the end of October. Send your application to the Programme Administrator.

Reading List

This list comprises texts providing a background to the programme, primarily the first term. Some are affordable and you may wish to purchase them. Many are comprehensive texts providing broad and detailed information on a subject and are available in the LSTM and/ or Harold Cohen libraries. Further recommended reading will be provided throughout the programme. Please note that this is not an exclusive list and there are many other useful texts held in the library. Also remember that these texts only provide basic background information and that a thorough and up-to-date knowledge of any field can only be gained by reading the scientific literature. All of the relevant journals are available in the Donald Mason Library.

General texts – Pathogens and Parasites

Not all content of the following texts will be appropriate to this programme, and students are advised to consult with staff as to recommended aspects for each text during the programme.

Farrar, J. et al. (2013) ***Manson's Tropical Diseases***. 23rd Edition. Saunders Ltd. ISBN: 978-0-7020-5101-2

Zeibig, E. (2012) ***Clinical Parasitology: A Practical Approach***. 2nd edition. Saunders. ISBN-10: 1416060448 ISBN-13: 978-1416060444

Beeching, N. & Gill, G. (2014). *Lecture Notes: Tropical Medicine*. 7th Edition edition. Wiley-Blackwell; ISBN-10: 0470658533 ISBN-13: 978-0470658536
